**Middle East Technical University, Ankara.**

**Some families of repeated-root cyclic codes.**

**Resumen:**

A cyclic code is called a repeated-root cyclic code if the codeword length and the characteristic of the alphabet are not coprime. Such codes are interesting in some cases. For instance self-dual codes in even characteristic are repeated-root cyclic codes and some families of cyclic codes are optimal.

Recently, the minimum Hamming distance and the ideal structure of certain families of cyclic codes of length  $np^s$  and  $2np^s$ , and in particular, the minimum Hamming distance of all cyclic codes of length  $p^s$  and  $2p^s$  have been determined.

In this talk, I will give an overview of these results.

Lugar: Departamento de Álgebra, Geometría y Topología.
